What is New in VeraLab 9.1.6

Release Date: 21-March-2024.

Enhancements and Updates

VeraLab version 9.1.6 comes with the following enhancements and fixes.

- Remote Client Update using a Schedule (Tools -> Remote Client Update).

- New option to export list of monitored applications from VeraLab into an Excel document and re-import back after reviewing and making changes.

- Performance improvements during server upgrades (applies only to VeraLab versions 9.0 or higher).

- Updated Booking UI (if you purchased VeraLab Booking App module). Here is a list of featured enhancements:
  o Additional views have been added to the Booking page. The original view is now labeled as "List." Two new options, "Grid" and "Map," have been introduced. Please note that the "Map" view requires LiveMaps to be configured and up to date.
  o A Booking Dashboard has been implemented, featuring a Heat Map and links to detailed reports.
  o The booking process has been streamlined for enhanced simplicity. Instead of drop-down menus, combo boxes are now utilized. Options are dynamically limited to what is available; for instance, users cannot select a resource or time slot that has already been booked by someone else. Overall, fewer clicks are required to complete a booking.
  o A link to the Room schedule has been incorporated for easy access.
  o Following the addition or deletion of a booking, users will receive a detailed confirmation message summarizing the action taken.
  o Cells displaying times when the lab is closed according to the schedule have been included.
  o Similar enhancements have been made to Class bookings for consistency and improved functionality.

Tech Stack Updates

VeraLab version 9.1.6 comes embedded with the following updated tech stack components.

- Tomcat 9.0.87 (includes security fixes for denial of service CVE-2024-23672 and CVE-2024-24549).
- JDK 17.0.10
- Postgres 14.11

Bug Fixes

VeraLab version 9.1.6 includes minor bug fixes discovered in previous releases.
